Definition of Terms:

Nitrogen (the first number in the three number set) Helps grass make the chlorophyll that gives a lawn its green color.

Phosphorus (the second number in the three number set) Promotes strong root development and winter hardiness. Helps prevent diseases.

Potassium (the third number in the three number set) Reduces loss of water through the blades. Strengthens the blade and helps withstand stress and disease.

Dimension Pre-emergent that helps prevent the germination of spring and summer broadleaf weeds; helps prevent the germination of grassy weeds such as crabgrass.

Iron Helps grass produce its deep green color.
